Subject: Letter to MI

You'll probably be asked to provide or vet a summary of what we can do. I think this is where we ended up.

Up front

- EPA can provide sampling and analytical support for private drinking water wells in the area of concern:
- EPA can provide additional analytical support to confirm that PFAS-contaminated water is being effectively treated prior to discharge;
- EPA labs in other regions may be able to provide additional analytical support for drinking water samples;
- EPA ORD could continue to provide technical support on water chemistry issues associated with distribution system changeover to Kalamazoo.

Other

Beyond the above, as discussed on the call HQ concurrence would be necessary for other forms of support, such as :

- Mobilization of Incident management expertise that could be mobilized to help organize response structure for state and local agencies;
- Mobilization of treatment systems to treat water being drained and flushed from Parchment system as well as treatment of water from Parchment's wells to acceptable PFAS levels to enable resumption of its distribution.
